THE REAL MANDATE

Close the gaps that specialization creates.

LATITUDE AI

ROLE THESIS

Integration is the mechanism that converts specialized engineering velocity into one launchable system.

COMPANY MOMENT

Latitude is moving an in-house, unified L2-to-L3 ADAS platform toward a 2027 debut on Ford Universal Electric Vehicle Platform.

OPERATING TENSIONS

Startup speed vs automotive launch discipline; full-stack ownership vs distributed domain authority; unified platform vs platform-specific configuration; architecture vs low-level debugging; feature velocity vs regression evidence.

SUCCESS CONDITION

Cross-domain ambiguity becomes a bounded problem, a coherent repair, and a stronger system contract than existed before the failure.

SYSTEM COHERENCE FRAME

Make the system agree with itself.

LATITUDE AI

INTERVIEW BRIEF 2/4

SIX COUPLED LAYERS

Platform configuration; compute and network; sensors and actuation; autonomy software; validation evidence; ownership and handoff.

CLOSURE SEQUENCE

1. Find the fracture. 2. Establish the invariant. 3. Restore the coupling. 4. Make recurrence harder.

DECISION RECORD

Observed behavior; expected invariant; minimum reproduction; competing hypothesis; authority boundary; system change; adjacent risk; release evidence; retained learning.

SCORECARD

Time to bounded hypothesis; minimum reproducible condition; blocker age; escaped regression behavior; configuration lineage; recurrence after closure.

EVIDENCE AND OBJECTION

Adjacent experience, translated honestly.

VAPE-JET

Approximately 1,000 fielded robots; cross-functional machine, customer, factory, quality, support, engineering, and telemetry signals.

ZEUSVU

Regulated autonomous drone operations with 100% safety record and no FAA incidents; TensorFlow-based aerial inventory and field-intelligence concepts.

COMPUNETICS

High-reliability electronics; engineering, manufacturing, quality, root cause, process controls, and technical stakeholder translation.

AMAZON AND DUDEWORTH

24/7 launch mechanisms, visibility, escalation, standard work, AI and automation workflow design.

HARD OBJECTION

No verified senior production C++ tenure or automotive autonomy-stack title. Ask for a bounded technical work sample and judge the reasoning, learning speed, code review behavior, and closure discipline directly.

INTERVIEW PLAN

Questions that expose the operating system.

QUESTION 1

Where do integration blockers most often lose time: reproduction, ownership, configuration identity, prioritization, or release evidence?

QUESTION 2

What distinguishes a strong integration closure from a defect that is merely no longer visible?

QUESTION 3

Which interfaces carry the greatest change burden as the unified platform approaches first vehicle launch?

QUESTION 4

When does Autonomy Integration implement a fix directly versus route it to the owning domain team?

QUESTION 5

What would prove after six months that this engineer increased organizational velocity and confidence?

QUESTION 6

Which platform or configuration problem would make the most realistic technical work sample?
