

MAP THE INTEGRATION SYSTEM

Learn platform, configuration, build, test, release, and blocker flows. Identify where software, firmware, calibration, hardware, network, environment, and ownership identities are recorded.

SHADOW LIVE DEBUGGING

Observe how experienced engineers move among architecture, logs, code, hardware state, test infrastructure, and cross-team communication.

LEARN EVIDENCE STANDARDS

Understand what constitutes a reproducible failure, a credible hypothesis, a sufficient regression, and an acceptable closure at Latitude.

CONTRIBUTE BOUNDED WORK

Take small, reviewable Python, test, tooling, configuration, or documentation tasks that expose technical judgment and accelerate learning.

PERSONAL MECHANISM

Use a lightweight closure record to capture observed behavior, invariant, reproduction, authority, change, release evidence, and learning without creating ceremony.

DAYS 31-60: BOUNDED CLOSURE

Own a defined issue set from intake through reproduction, repair coordination, validation, and closure communication. Improve environment identity and blocker precision. Add targeted tests or checks where evidence supports them.

DAYS 61-90: INTEGRATION SLICE

Lead one platform or feature integration slice across configuration, build, system behavior, partner alignment, validation, and release evidence.

REPEATED BOUNDARY FAILURES

Review closures for recurring violated invariants, configuration gaps, ownership ambiguity, observability weaknesses, and testing blind spots.

ONE HIGH-LEVERAGE IMPROVEMENT

Implement or sponsor a bounded compatibility check, configuration diff, targeted regression test, observability improvement, or clearer evidence contract.

90-DAY REVIEW

Assess trust, technical contribution, blocker flow, traceable evidence, retained learning, and the next area where deeper ownership creates value.
