Hiring Team
Latitude AI
2545 Railroad Street, Suite 400
Pittsburgh, PA 15222

Dear Latitude AI Hiring Team,

Latitude is hiring for a problem that becomes harder as the technology becomes more capable: how to make a vertically integrated autonomy stack behave as one product when a failure crosses software modules, hardware, network interfaces, platform configuration, validation evidence, and team boundaries.

That is the work I am drawn to. Across software-enabled robotics, regulated autonomous systems, advanced electronics, quality, and 24/7 launch operations, my recurring contribution has been to enter an ambiguous problem, connect evidence that lives in different domains, make the failure reproducible, align the right owners, and leave behind a stronger operating mechanism than existed before the issue.

At Vape-Jet, I connect machine-fleet, customer, factory, quality, support, engineering, and telemetry signals across approximately 1,000 fielded robots. At ZeusVu, I led regulated autonomous drone operations with a 100% safety record and no FAA incidents while developing TensorFlow-based concepts for computer-vision field intelligence. At Compunetics, I led high-reliability engineering, manufacturing, quality, and technical programs, building root-cause practices and process controls for high-consequence customers. At Amazon, I built visibility, escalation, and standard work in a 24/7 launch environment supporting approximately five million second-day orders annually.

My thesis for this role is simple: integration is not the phase after engineering. It is the mechanism that turns specialized velocity into one launchable system.

I would bring immediate value in the seams where integration work slows: framing precise problem statements, correlating evidence across domains, pinning configuration identity, designing discriminating experiments, and translating closure into targeted tests, controls, and ownership. I am ready to work directly in Latitude's code, configuration, and validation environment, pair with domain experts, and let evidence determine the next experiment.

I built an independent candidate vision at russelldudek.github.io/latitude/. It makes my reasoning visible through a System Coherence Frame, scenario-based integration closure model, 90-day entry plan, evidence map, and reusable Integration Closure Record. The work is not presented as knowledge of Latitude's undisclosed processes; it is a transparent demonstration of how I would approach the mandate.

Latitude's combination of startup speed, full-stack ownership, Pittsburgh engineering depth, and Ford's launch scale is rare. I would welcome the opportunity to show how my systems thinking, tenacity, technical fluency, and adjacent robotics experience can increase the team's ability to close the gaps that matter.

Carpe diem,

Russell Dudek
